

Empathy Map Canvas

Project Title

Virtual Agent–Driven SLA Breach Awareness & Justification System

Introduction

An Empathy Map Canvas helps identify the needs, thoughts, behaviors, and challenges of users interacting with a system. For the Virtual Agent–Driven SLA Breach Awareness & Justification System, the primary users include support agents, team leads, and administrators responsible for monitoring and maintaining Service Level Agreements (SLAs).

Understanding the users' perspectives helps design a solution that proactively prevents SLA breaches, simplifies incident management, and improves accountability through automation and AI-assisted decision-making.

User Persona

Primary Users

- Support Agent
 - Team Lead / Manager
 - System Administrator
-

Empathy Map

1. What Does the User Think and Feel?

Support personnel want to resolve incidents efficiently while ensuring SLA compliance. They are concerned about missing deadlines, handling multiple tickets simultaneously, and maintaining service quality.

Common thoughts include:

- "I don't want any incident to breach its SLA."
 - "I need timely reminders before deadlines."
 - "Managing multiple incidents manually is difficult."
 - "I need clear guidance on handling SLA risks."
 - "Accurate dashboards would help me prioritize work."
-

2. What Does the User See?

Users interact with:

- Incident management dashboards.
- SLA countdown timers.
- Ticket priority indicators.
- Risk classification (SAFE, AT RISK, BREACHED).
- Virtual Agent notifications.
- Performance reports.
- Real-time analytics.

They expect the system to provide clear and organized information for effective decision-making.

3. What Does the User Say?

Typical user statements include:

- "Notify me before the SLA expires."
 - "Show me which tickets require immediate attention."
 - "Help me understand why this ticket is at risk."
 - "I need an easy way to justify potential SLA breaches."
 - "Provide reports that summarize SLA performance."
-

4. What Does the User Do?

Users typically:

- Monitor assigned incidents.
 - Track SLA progress.
 - Respond to Virtual Agent alerts.
 - Update incident information.
 - Provide breach reasons and justifications.
 - Acknowledge SLA risks.
 - Review dashboards and reports.
 - Take corrective actions to prevent SLA violations.
-

Pains

Users experience several challenges during daily operations:

- Difficulty tracking numerous active incidents.

- Manual monitoring of SLA deadlines.
 - Late identification of SLA risks.
 - Inconsistent documentation of breach reasons.
 - High workload during peak support hours.
 - Lack of proactive notifications.
 - Limited visibility into team performance.
 - Difficulty prioritizing incidents.
-

Gains

The proposed system provides several benefits:

- Early detection of SLA risks.
 - AI-assisted breach justifications.
 - Automated notifications.
 - Simplified incident monitoring.
 - Improved accountability.
 - Better workload prioritization.
 - Accurate dashboards and reports.
 - Reduced SLA violations.
 - Increased operational efficiency.
 - Improved customer satisfaction.
-

User Needs

The users require a system that can:

- Continuously monitor SLA progress.
- Predict potential SLA breaches.
- Classify incidents based on SLA risk.
- Provide proactive alerts.
- Explain SLA risks through an intelligent Virtual Agent.
- Capture breach reasons and acknowledgements.
- Generate real-time reports.
- Support secure role-based access.

Proposed Solution

The Virtual Agent–Driven SLA Breach Awareness & Justification System addresses these needs by combining workflow automation, AI-powered assistance, and real-time monitoring. The system continuously evaluates SLA status, alerts users before deadlines are missed, provides intelligent explanations using Google Gemini AI, and maintains complete accountability through dashboards, notifications, audit trails, and reporting.

Conclusion

The Empathy Map Canvas highlights the challenges faced by IT support teams in managing Service Level Agreements. By understanding user expectations and operational pain points, the proposed solution delivers proactive SLA monitoring, intelligent guidance, and automated workflows that improve service quality, accountability, and overall IT service management efficiency.
